

Parental Rights and Vaccination Choice

FACT SHEET

- New Jersey mandates that children receive as many as 49 doses of 14 vaccines before they reach age six, which is over 10 times higher than the number of doses administered to children in 1940.
- Vaccination is a medical procedure that carries with it the possibility of injury and death for some. In 1986, Congress declared that vaccines are "unavoidably unsafe." Parents must have the right to decide if their child(ren) should receive some vaccines, all vaccines, or no vaccines. **Any and all medical procedures must have the option to be declined.**
- **Over \$4 BILLION to date has been paid by the federal government to compensate families for vaccine injury and death.** ¹
- Since 1990, there have been **nearly 7,000 reports of SEVERE adverse effects and more than 250 DEATHS associated with the measles, mumps, and rubella (MMR) vaccines** in the US, as reported to the VACCINE ADVERSE EVENT REPORTING SYSTEM (VAERS). (NOTE: Only a fraction of adverse reactions are reported to VAERS^{2,3,4}, estimated at about 1-10% of the actual figure. This means, SEVERE adverse reactions are actually about 70,000 to 700,000, and DEATHS from MMR are closer to 2,500 to 25,000 during this period.)
- **Live virus vaccines, including the MMR, rotavirus, chicken pox, shingles and influenza vaccines have the potential of recipient shedding for several weeks.** It is a known medical fact that those who are immunocompromised should avoid contact with the recently vaccinated. Vaccinated individuals spread disease.⁵
- **The National Childhood Vaccine Injury Act of 1986 removed liability from vaccine manufacturers. Meaning, if you or your child is injured or killed by a government-recommended vaccine the vaccine manufacturer cannot be sued for damages.** There is no incentive for Pharma to make the safest possible product. Who is tracking the cost to NJ Taxpayers for the vaccine injury burden?
- Vaccines have been found to be contaminated with glass⁶, metal⁷, pig virus⁸, countless other animal virus fragments previously asserted to be filtered out during manufacturing. Most recently it was discovered that **GLYPHOSATE is in all vaccines.**⁹ The main ingredient in Monsanto's Roundup, Glyphosate is the reason for a \$289 million judgement against Monsanto for causing a father's cancer.
- According to the FDA, the maximum level of aluminum for a healthy 8-pound baby is 18.16 mcg and for a healthy 30-pound toddler is 68.1 mcg. The hepatitis B vaccine administered at birth contains 250 mcg. Each DTaP vaccine carries aluminum levels of 170 to 625 mcg, depending on manufacturer, and 4 doses are

administered before 18 months. Other vaccines have similar aluminum levels. **There is no study that assesses the risk of the current childhood schedule.** Each vaccine is tested and evaluated in isolation.

- Sample of moderate and severe vaccine adverse events: Death/SIDS, short-term or long-term seizures, coma, lowered consciousness, permanent brain damage, bleeding disorder, pneumonia, deafness, nausea, vomiting, diarrhea, stomach ache, headache, rash, hives, pain in the joints, non-stop crying (3 hours or more), high fever, and serious allergic reaction. (Source: CDC website)
- Sample of vaccine ingredients: Aluminum, formaldehyde, tissue fragments from aborted fetuses (found in MMR, chicken pox, hepatitis A, and rabies vaccines), MSG, phenol, methanol, borax, glutaraldehyde, sulfate and phosphate compounds, latex, fragments of animal tissue, proteins from eggs, milk and calf/cattle, latex. (Please note: Many of the ingredients are known carcinogens, some are toxic to various body organs, and others can trigger severe allergic reactions.)
- **New Jersey currently has one of the highest childhood vaccination rates in the country with 95% vaccinated.**¹⁰ NJ requires more vaccinations than most states, and NJ is one of the leaders in developmental disabilities, learning disabilities, and attention deficit hyperactivity disorder (ADHD), among others, and leads the country in Autism rates of 1 in 34 (vs a national rate of 1 in 57).¹¹

Questions to ask before voting to remove vaccine exemptions:

- Merck holds a monopoly on MMR vaccine. Two former Merck scientists, turned whistleblowers, are suing Merck alleging they falsified MMR mumps efficacy data. Merck is also in California State Supreme Court facing fraud, deceit and negligence over its Gardasil vaccine. How can we continue to mandate vaccines that are currently on trial for fraud?¹²
- Are you aware that Merck, the manufacturer of MMR, has paid out over \$3 BILLION in penalties involving unethical behavior in the last 20 years.¹³ With no liability for vaccines and the ability to pay out \$3 billion and still remain profitable, what assurances can you provide, as our legislators, that this company will do right by our children, with absolutely no incentives to do so?
- If measles is so serious and sheds live virus,¹⁴ why are we not actively quarantining freshly vaccinated children from the classroom in order to prevent potentially spreading the measles infection?
- In 1963 scientists said one dose of measles vaccine would eliminate measles by 1967. Thirty-three years and a two-dose requirement later, measles was declared eliminated. A proposed 3rd dose is on the horizon. At what point do we re-evaluate and realize that vaccines may not be providing the protection we were promised? In what way is this not an experiment subject to the standards set at Nuremburg?
- Measles, mumps and whooping cough outbreaks have occurred amongst fully vaccinated populations^{15,16,17,18} Do you know that there will still be outbreaks no matter what the coverage level because of primary and secondary vaccine failure?
- New Jersey's own Holly's Law was created in memory of 5-year-old Holly Stavola, who died as a result of her second MMR vaccine.¹⁹ Why are we so willing as a society to accept deaths and injury from vaccines, yet we are not accepting of common childhood infections? What makes one child's life more important than another's?
