

The “Herd Immunity” Myth

The term “herd immunity” was originally coined to describe what happens to a population when a disease is contracted and fought off naturally, giving those infected lifetime immunity from the disease. Vaccine proponents misappropriated the term and have been using it inaccurately regarding vaccine-induced immunity. In fact, “herd immunity,” as it applies to vaccines, is not a scientifically validated concept, let alone one that applies definitively, predictably, or preventatively to vaccinated communities. There is absolutely no scientific data to back it up. It is a scientific fact, however, that the recently vaccinated shed the virus they are supposed to have been “protected” against leaving a continuing trend of diseases spreading from bodily secretions.

-Herd immunity is NOT an immunologic idea, but rather an epidemiologic construct, which theoretically predicts successful disease control when a certain pre-calculated percentage of people in the population are immune from disease. -Dr. Obukhanych, Harvard-trained immunologist.

-Today millions of adults exist with having NO vaccines in decades and millions of teens who have not had their boosters. It was discovered that most of these vaccines lost their effectiveness 2-10 years after being given. This is why they quietly began to suggest boosters for most vaccine. -Dr. Blaylock

-Vaccination does NOT equal immunization. Natural immunization is a complex interactive process involving many bodily organs and systems; it cannot be replicated by the artificial stimulation of antibodies. -Dr. Mercola

-The fact is that vaccination does NOT stop you from carrying bacteria or viruses in your nose, throat, intestines, airway, skin, or in your body. We have been made to believe that if you're vaccinated, you won't carry the viruses, and therefore, others will be protected because you're vaccinated. This belief is NOT based on scientific fact. -Gianelloni

-If the concept of herd immunity is the bedrock of government mandates to increase vaccination compliance, where is the evidence that this is reasonable, realistic, or a safe goal to strive for? -Dr. Kelly Brogan

Parents are ultimately responsible for their child(ren), NOT “the herd” and thus medical decisions, including vaccinations, should be a collaborative discussion between parents and their child’s health care provider. Vaccines carry an inherent possibility for side effects from minor site reactions to severe events including death. Proponents of vaccine mandates use the argument that vaccinating the “herd” protects the immunocompromised population from diseases even though vaccine package inserts warns that those recently vaccinated should stay away from the immunocompromised due to recipient shedding.
